

Insurance for an uncertain climate

March 25th, 2016

The application of insurance as a mechanism to help vulnerable people adapt to the impacts of climate change is gaining international support. Experts support the idea but warn of potential problems.

In December, negotiators at the Paris climate meeting adopted insurance as an instrument to aid climate adaptation. Earlier in the year, the leaders of the G7 pledged to bring climate insurance to 400 million uninsured individuals in poor countries by 2020.

In a new article in the journal *Nature Climate Change*, experts from the London School of Economics and Political Science, Deltares and International Institute for Applied Systems Analysis welcome these developments, but also lay out the difficulties that policymakers will face in turning the ideas into action. They warn that ill-designed and poorly implemented insurance instruments could fail to reach the goals of negotiators, or worse, prove detrimental to the very people they are intended to protect.

Swenja Surminski, Senior Research Fellow at the Grantham Research Institute on Climate Change and the Environment at the London School of Economics and Political Science led the article. She says, “Poor communities are much more impacted by extreme weather such as floods, droughts, and heatwaves. Rather than ad-hoc and unpredictable payments after these events, insurance approaches can be set up in advance of these impacts, and be more efficient and provide better support to these vulnerable people”

While insurance could provide funding to help people in need, the researchers point out several ways that such mechanisms could fail:

- Any new insurance scheme in developing countries needs to overcome difficult challenges, including lack of risk data, limited financial literacy, and weak financial infrastructure;
- Insurance for the poor will only be viable if it is linked to adaptation and risk reduction efforts that reduce the underlying risk factors including climate-resilient infrastructure, adapted agricultural practices, and early warning systems; otherwise climate insurance will be short-lived and far from cost-effective;
- Traditional insurance is an expensive mechanism with high transaction and capital costs, making premiums far higher than expected losses. This suggests that adaptation funds might be better spent on other types of safety net rather than on buying insurance cover from international insurance markets;
- Insurance will need high levels of subsidies or other forms of support to render it affordable and to avoid shifting responsibility on to those who are the least responsible for climate change, the least able to shoulder the premiums, and in many cases the least able to reduce their losses.

In order to avoid these problems, the researchers argue, policymakers should consider climate insurance as part of a wider adaptation strategy rather than in isolation or as an alternative to adaptation. Surminski: “When installing an insurance scheme, climate change and other factors contributing to the risks need to be taken into account. Insurance needs to be coupled to adaptation efforts to deal with these risk factors, otherwise climate insurance will not be sustainable nor cost-effective.”
